---

A wind turbine turns wind energy into electricity using the aerodynamic force from the rotor blades, which work like an airplane wing or helicopter rotor blade.

The power-generating process of wind energy begins with the blades, which are engineered to capture the kinetic energy of moving air. As wind flows over these aerodynamic ...

Non-ionizing radiation, which includes the electromagnetic fields produced by wind turbines, does not carry enough energy to cause damage to biological tissue, making it substantially ...

To truly understand how wind turbines generate power--from the movement of their blades to the delivery of electricity into the grid--it is essential to explore every stage of the process, ...

Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. The blades are connected to a drive shaft that turns an electric generator, ...

Building new wind turbines does create some greenhouse gas emissions--from making the steel for their towers and fiberglass for their blades, and mining the rarer minerals sometimes ...

Wind is a renewable energy source that uses the power of moving air to generate electricity. Wind turbines use blades to collect the wind's kinetic energy. Wind flows over the blades creating lift ...

How does wind produce energy? It's a fairly simple process: When the wind blows, the turbine's blades spin which captures energy. This energy is then sent through a gearbox to a generator, which ...

Vertical-axis wind turbines (VAWTs) have varied, unusually shaped blades that rotate in complete circles around their tower. The main rotor and generator are located near the ground, ...

## There is radiation near the wind blades that generate electricity

Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan--wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor, ...
